

Windows 10 Professional – Domain Logon

Before joining Windows 10 Professional to the domain you must first run the registry script "joindomain.reg". This registry script can be found in the "\\server\netlogon_v2\registry\computer" folder.

Windows 10 also has additional security policies in place when accessing UNC shares. By default, Windows 10 will display "Access is denied" when you browse the "netlogon" share. To fix this problem you need to update a group policy setting in Windows 10.

Step 1:

Run gpedit.msc

Computer -> Administrative Templates -> Network - Network Provider -> Hardened UNC Paths

Hardened UNC Paths -		×	
		Previous setting mext setting	
O Not Configured	Comment:		^
Enabled			
 Disabled 			\sim
	Supported on:	ted on: At least Windows Vista	
			\vee
Options:		Help:	
Hardened UNC Paths	Show	 This policy setting configures secure access to UNC paths. If you enable this policy, Windows only allows access to the specified UNC paths after fulfilling additional security requirements. 	^

Enable the policy, click the **[Show]** button and enter "**netlogon*" into the "*Value name*" field and "*RequireMutualAuthentication=0,RequireIntegrity=0,RequirePrivacy=0*" into the "*Value*" field.

Click OK twice and close the group policy editor.

Step 2:

Right-click on the Start Menu and choose System. Click "*Change settings*" under the "*Computer name, domain, and workgroup settings*" section, then click the "*Change...*" button from the System Properties window that appears.

Computer name, domain, ar	nd workgroup settings	
Computer name:	SMART-PC	S Change settings
Full computer name:	SMART-PC	
Computer description:		
Workgroup	WORKGROUP	

Select the "*Domain*" option from the Computer Name/Domain Changes window, enter the domain name of your Smart-Net server (e.g. WORKGROUP), then click OK.

You c compi <u>More</u>	an change the nam uter. Changes might information	e and the memb affect access to	ership of this o network reso	ources.
